Submersible Pumps

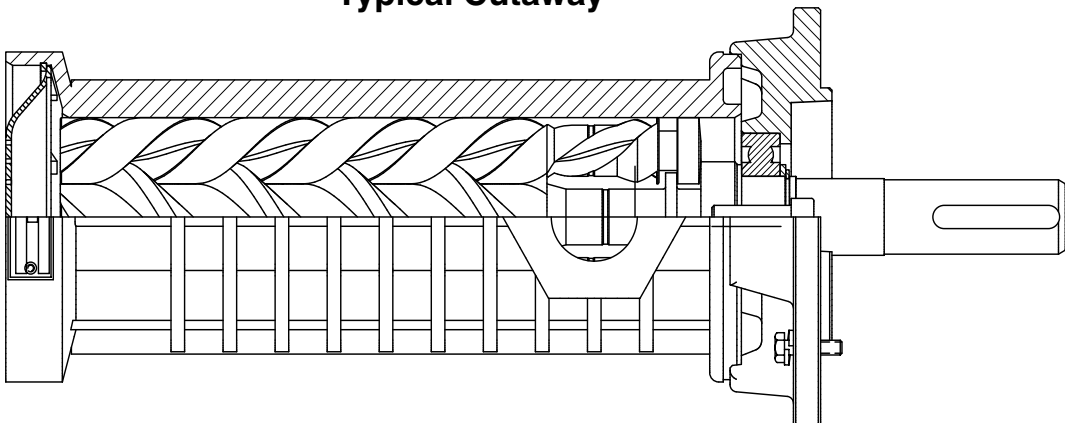

4PIC Specifications and Features

Rotor Housing	Aluminum
Power Rotor	Steel
Idler Rotors	Pearlitic Iron
Operating Pressure	1000 psi maximum
Inlet Pressure	Submersed in tank
Viscosity	Minimum 60 SSU
Temperature	0°F – 180°F
Drive	Direct Drive Only with submersible motor
Rotation	Clockwise, as viewed facing pump shaft
Mounting	Flange mounted directly to submersible motor
Discharge Connections	Refer to page 3 in this publication
Filtration	Inlet Strainers are supplied

Typical Section

Typical Cutaway

Dry Mounted Pump Dimensions, Rotor Sizes 137 - 350

- NOTES:**
- Dimensions are for cast iron cased pumps.
 - "U" dimensions are subject to standard NEMA tolerances.
 - Dimension "AH" is weld socket (weld by customer). Removable socket weld flange is included with pump.
 - Top inlet position is standard.
 - A3DB-137 has 1 1/2 inch NPT inlet and 1 inch NPT outlet, **NOT** as shown above.
 - A3DB-156 has 2 inch NPT inlet and 1 inch NPT outlet, **NOT** as shown above.
 - G3DB-187 has 2 1/2 inch NPT inlet and 1 1/2 inch NPT outlet, **NOT** as shown above.
 - All table values are approximate. No tolerances are implied.

Dry Mounted Hydraulic Elevator Performance Curves

Dry Mounted Elevator Pumps

Specifications and Features

Rotor Housing	Iron
Power Rotor	Ground Alloy Steel
Idler Rotors	Ground Pearlitic Iron
Operating Pressure	To 500 psig – Belt Drive (see Performance Charts*) To 500 psig – (contact Factory for details)
Viscosity	100SSU minimum at maximum temperature**
Temperature	0°F–160°F
Drive	Direct or Belt
Rotation	Clockwise, facing pump shaft
Mounting	Any attitude
Shaft Seal	Mechanical seal with Buna N bellows, carbon rotating face and iron stationary seat
Bearing	Cartridge-type, permanently grease-packed, single row radial deep groove ball bearing
O-Rings	BunaN
Gaskets	Cellulose fiber
Filtration	60 – 100 mesh suction strainer recommended

* Sizes 275-350 suitable for 500 psi belt drive. Consult Imo for details.

** Lower viscosities may be permissible with review and approval by Imo Pump.

Dry Mounted Elevator Pumps

Installation Guidelines

To assure trouble free operations, please follow these guidelines:

Mounting

Mount pump and motor as integral units on common, rigid baseplate to avoid shifting and misalignment. Isolation pads (bracket to frame) will help reduce vibration. Check motor/pump rotation to avoid pump damage.

Belt Drive

Sheaves must be balanced and shaft bores must be concentric with belt grooves. Place sheave close to bearing retainer. Avoid sheave misalignment by using straight-edge to ensure alignment.

Adjust belt tension to manufacturer's recommendations.

Suction Conditions

Size piping adequately and avoid multiple fittings. Install 60-100 mesh strainer on suction line to protect pump. Assure adequate surface area to avoid excessive pressure drop when dirty.

Do not exceed pump suction capability to

avoid cavitation which causes noise, vibration and pump damage.

Lowest oil level of reservoir must cover inlet-line to prevent vortexing. Place return lines below lowest oil level. Keep reservoir and piping clean at all times. Clean system before each start-up. Vent reservoir through filter/breather to exclude dirt.

Temperature

Avoid exceeding oil temperature specifications. (Normal oil temperature range is 60°F to 135°F for most installations). Install tank heaters as required. Run bypass lines from hydraulic block or valve to reservoir, not to pump suction.

Start-Up

Fill pump with oil before start-up. Open suction and discharge valves, bleed system air and start pump under low pressure. Check system for air leaks, especially suction piping. Set pressure valve at lowest pressure consistent with satisfactory elevator operation.

Service Hints

If operation of the pump is noisy, check the following points:

1. Air entrained in oil, or leaks in suction line.
2. Vortexing or low oil level in reservoir.
3. Restrictions in suction line or clogged strainer.
4. Incorrect alignment of pump and motor.
5. Excessive belt tension or slip.
6. Motor, pump, bracket or other component loose.
7. Unmatched belt set, or unbalanced sheave.
8. Pump suction capability exceeded – oil too cold or pump speed excessive.
9. Worn pump.
10. Damaged or unbalanced motor.

If there is no oil flow or pressure is too low, check the following points:

1. Restricted pump suction.
2. Control valve damaged or malfunctioning.
3. Excessively cold and viscous oil.
4. Low oil in reservoir.
5. Incorrect motor rotation.
6. Belts slipping.
7. Worn or damaged pump.

Req. GPM = Total Area x .0519 x Car Speed Req.

Car Speed = (GPM/ Total Area) x 19.27

Note: Check with cylinder manufacturer for actual cylinder size/displacement.
